

GNS-AI and Denodo

Partnering to enhance generative AI outcomes with a focused data strategy

Why GNS-AI and Denodo?

As generative AI continues to revolutionize a variety of industry sectors, challenges such as data fragmentation, inherent biases, and AI “hallucinations” (generating incorrect or nonsensical information) persist, hindering the full potential of AI applications. Today, many organizations face four key challenges with regard to AI:

- **Data Quality and Fragmentation:** Integrating high-quality, diverse data sources for AI model training and operation.
- **Bias and Hallucination:** Mitigating bias and reducing the occurrence of AI hallucinations by ensuring balanced, contextually relevant data.
- **Scalable and Flexible AI Solutions:** Providing adaptable AI applications to meet evolving industry needs and data landscapes.
- **Ethical and Transparent AI Practices:** Upholding ethical standards and transparency in AI deployments.

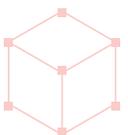

Working together, GNS-AI and Denodo enable companies to overcome each of these challenges, for more accurate, ethical, and contextually relevant AI outputs while reducing hallucinations through better training and a comprehensive data strategy.

What Denodo Brings

The Denodo Platform’s approach to data management is a paradigm shift from the traditional approach of first requiring data to be copied or replicated into a central repository before it can be analyzed or leveraged. Instead, the Denodo Platform leverages a logical data management method enabled by data virtualization, which establishes a centralized data-access layer that simplifies and accelerates access to data stored in distributed systems and formats.

What GNS-AI Brings

GNS-AI stands out in AI and data science by offering specialized services that meet the evolving needs of today’s businesses. With advanced expertise in forefront AI technologies, GNS-AI enables organizations to gain insights from their AI-powered solutions that extend beyond traditional analysis. GNS-AI is committed leader in the ethical application of AI technologies, ensuring the maximum alignment between business goals and societal standards. GNS-AI leverages a worldwide network of development teams to offer scalable, efficient AI and software solutions tailored to specific organizational needs, enabling swift integration and deployment.

SOLUTION OVERVIEW

The synergistic combination of the Denodo Platform’s logical data management capabilities with GNS-AI’s consultancy services provides a powerful solution to these AI challenges:

- **Comprehensive Data Integration:** Utilize the Denodo Platform to amalgamate data from a wide variety of sources, creating a rich, trusted dataset for AI training and application.
- **Bias and Hallucination Reduction:** Apply GNS-AI’s expertise to implement best practices and checks that reduce bias and minimize hallucinations in AI outputs.
- **Contextual Relevance and Accuracy:** Ensure AI-generated content and predictions are contextually appropriate and accurate by leveraging enriched, diverse data sets.
- **Ethical AI Framework:** Establish ethical AI practices, fostering extended trust and reliability in AI applications.

Integration with the Denodo Platform and GNS-AI

This collaborative approach enables organizations to:

Access Rich, Varied Data:

Aggregate and refine data from disjointed sources, providing a solid foundation for generative AI.

Enhance AI Training and

Outputs: Implement robust training regimens that reduce hallucinations and increase the accuracy of AI models, supported by GNS-AI’s strategic guidance.

Customize and Scale AI

Solutions: Tailor generative AI tools to specific contexts and needs, supported by a flexible and comprehensive data architecture.

Promote Ethical AI

Utilization: Develop and adhere to ethical guidelines and frameworks, enhancing transparency and fairness in AI use.

Common Use Cases:

Accurate Content and

Data Generation: Produce precise and relevant content for a variety of applications, minimizing errors and hallucinations.

Innovative Product and

Service Design: Utilize AI for creating or improving products/services based on a well-rounded understanding of market needs.

Reliable Predictive Analytics:

Build forecasting models with reduced bias and higher accuracy for sectors like finance, healthcare, and logistics.

Ethical Decision-Making

Processes: Foster decision-making mechanisms in AI systems that are fair, transparent, and free of unethical biases.

GNS-AI + Denodo

Integrating Denodo’s logical data management capabilities with GNS-AI’s consultancy services provides a formidable solution to the prevalent challenges in generative AI, including data inconsistencies, biases, and hallucinations. By ensuring the availability of comprehensive, high-quality datasets and implementing ethical AI frameworks, organizations can significantly enhance the reliability, relevance, and fairness of their generative AI applications. This approach not only accelerates technological innovations but also ensures that they are sustainable, ethical, and effectively aligned with organizational goals and societal norms.
