

DENODO ADD-ON FOR SAP SOLUTIONS

Unified semantic layer for SAP and non-SAP applications

The Denodo Add-on for SAP Solutions allows SAP customers to get access to SAP applications through the Denodo semantic layer. Users can generate data products in Denodo assisted by AI combining data across non-SAP and SAP applications, secure and govern those data products with fine-grained policies and expose them for consumption through a data marketplace to business users and applications.

Unified secured and governed data access layer for SAP and non-SAP applications

The Denodo Add-on for SAP Solutions enables Denodo users to get access to SAP applications. The Denodo unified semantic layer sits on top of SAP and non-SAP systems, helping SAP customers to deal with data from the non-SAP world that can be easily consumed by BI/data science/enterprise tools. Denodo guarantees secured and governed access to all data enforcing policies that can be defined at different levels in a federated governance architecture.

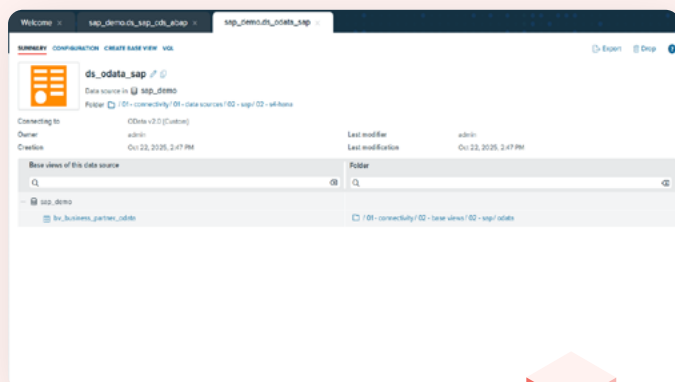

Smart and efficient data load into SAP systems

Load data from any data source using Denodo rich set of connectors into SAP HANA for facilitating data consumption for SAP users. SAP customers can easily leverage Denodo connectors and import data views that can be persisted into SAP HANA. Denodo also leverages SAP HANA as a Denodo cache system for smart query acceleration with significant performance improvements.

Data marketplace for self-service

Empower business users to browse, search, and preview available data products combining data from non-SAP and SAP systems, complete with definitions, lineage, and quality indicators. Enable business users to carry out last-mile customization through user-friendly “WSYWYG” data preparation interfaces, query data using business friendly wizards and natural language interfaces based on GenAI.

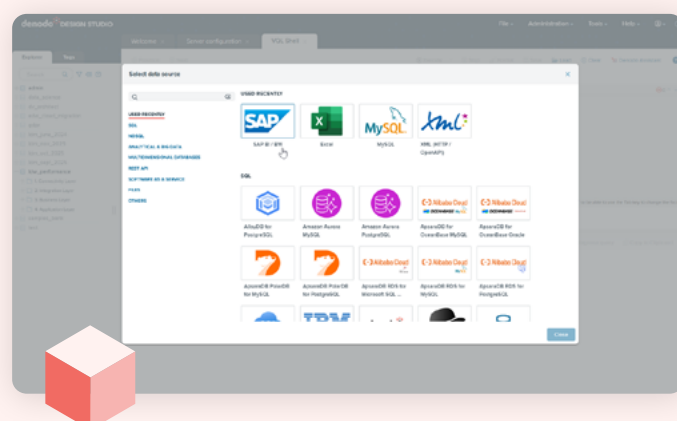

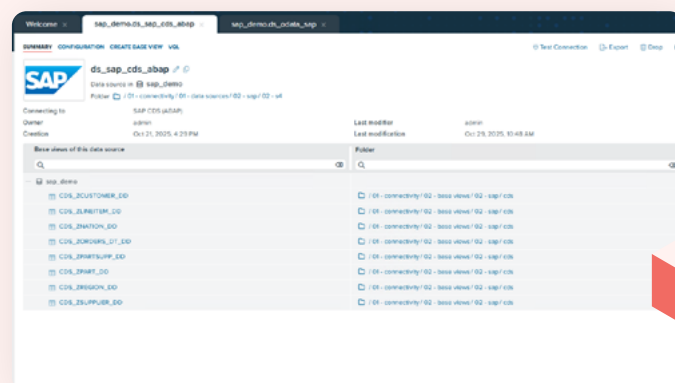

Integration with the SAP ecosystem

The Denodo Add-On for SAP Solutions allows a powerful integration of SAP systems including ECC, BW, S/4HANA, BW/4HANA, Datasphere and Business Data Cloud. Denodo leverages powerful connectors such as SAP BAPIs for ECC, the ODBC for ABAP driver for SQL access to CDS and the OData connector.

SQL access to Core Data Services

The Denodo SAP CDS (ABAP) adapter allows SQL queries against ABAP Core Data Services bringing unrestricted SQL access to all exposed ABAP CDS view entities. Data from different entities can be joined in an ad-hoc fashion and data can be aggregated for analytical queries.

Multi-dimensional Adapter for SAP BI/BW

The Denodo Add-on for SAP Solutions includes a multi-dimensional adapter for SAP BI/BW. The user can import views from those systems including using variables from BEx Queries. Denodo caches the metadata of SAP to speed up the queries to multidimensional base views.
