

DATA VIRTUALIZATION

Packed Lunch Webinar Series

Sessions Covering Key Data Integration
Challenges Solved with Data Virtualization

Augmentation, Collaboration and Governance are Defining the Future of Self-Service BI

Saptarshi Sengupta

Director of Product Marketing

Agenda

1. Broadening Horizon of Self-Service BI/Analytics
2. Problems with Self-Service BI/Analytics
3. The Role of Logical Data Fabric in Self-Service BI/Analytics
4. Customer Success Story – Democratizing Data @PROLOGIS
5. Conclusion

Broadening Horizon of Self-Service BI/Analytics

Case in Point

Data Democratization at LeasePlan

About LeasePlan | World Leader in Fleet Management

1963

Founded

Present in

32

countries

#1 EU
reseller

LP Group B.V.

Investor consortium

Shareholder

6,600+

Employees

HQ

Amsterdam

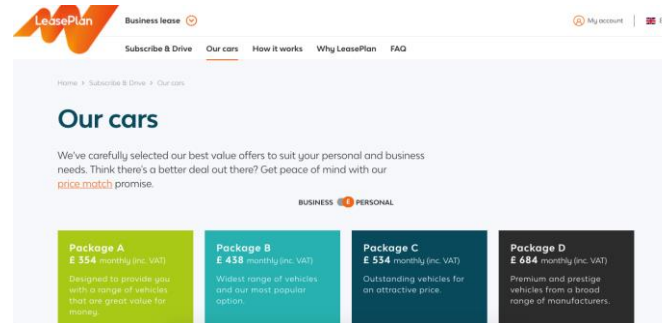

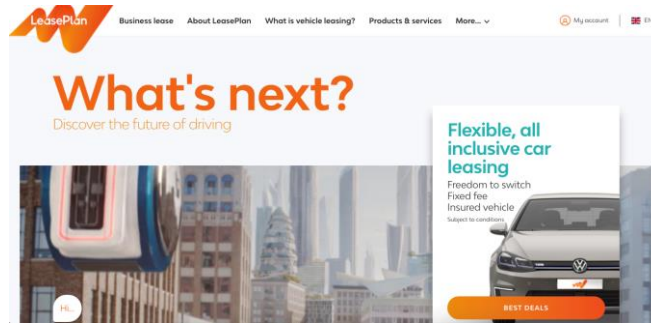

175,000+

Worldwide customers

Size of fleet

1.9
million

Vehicle Lifecycle | End-to-end Services Focus

LeasePlan typically owns the car and therefore owns the value chain

Purchase

Financing

Insurance

Maintenance Management

Fuel Management

Accident Management

Rental Management

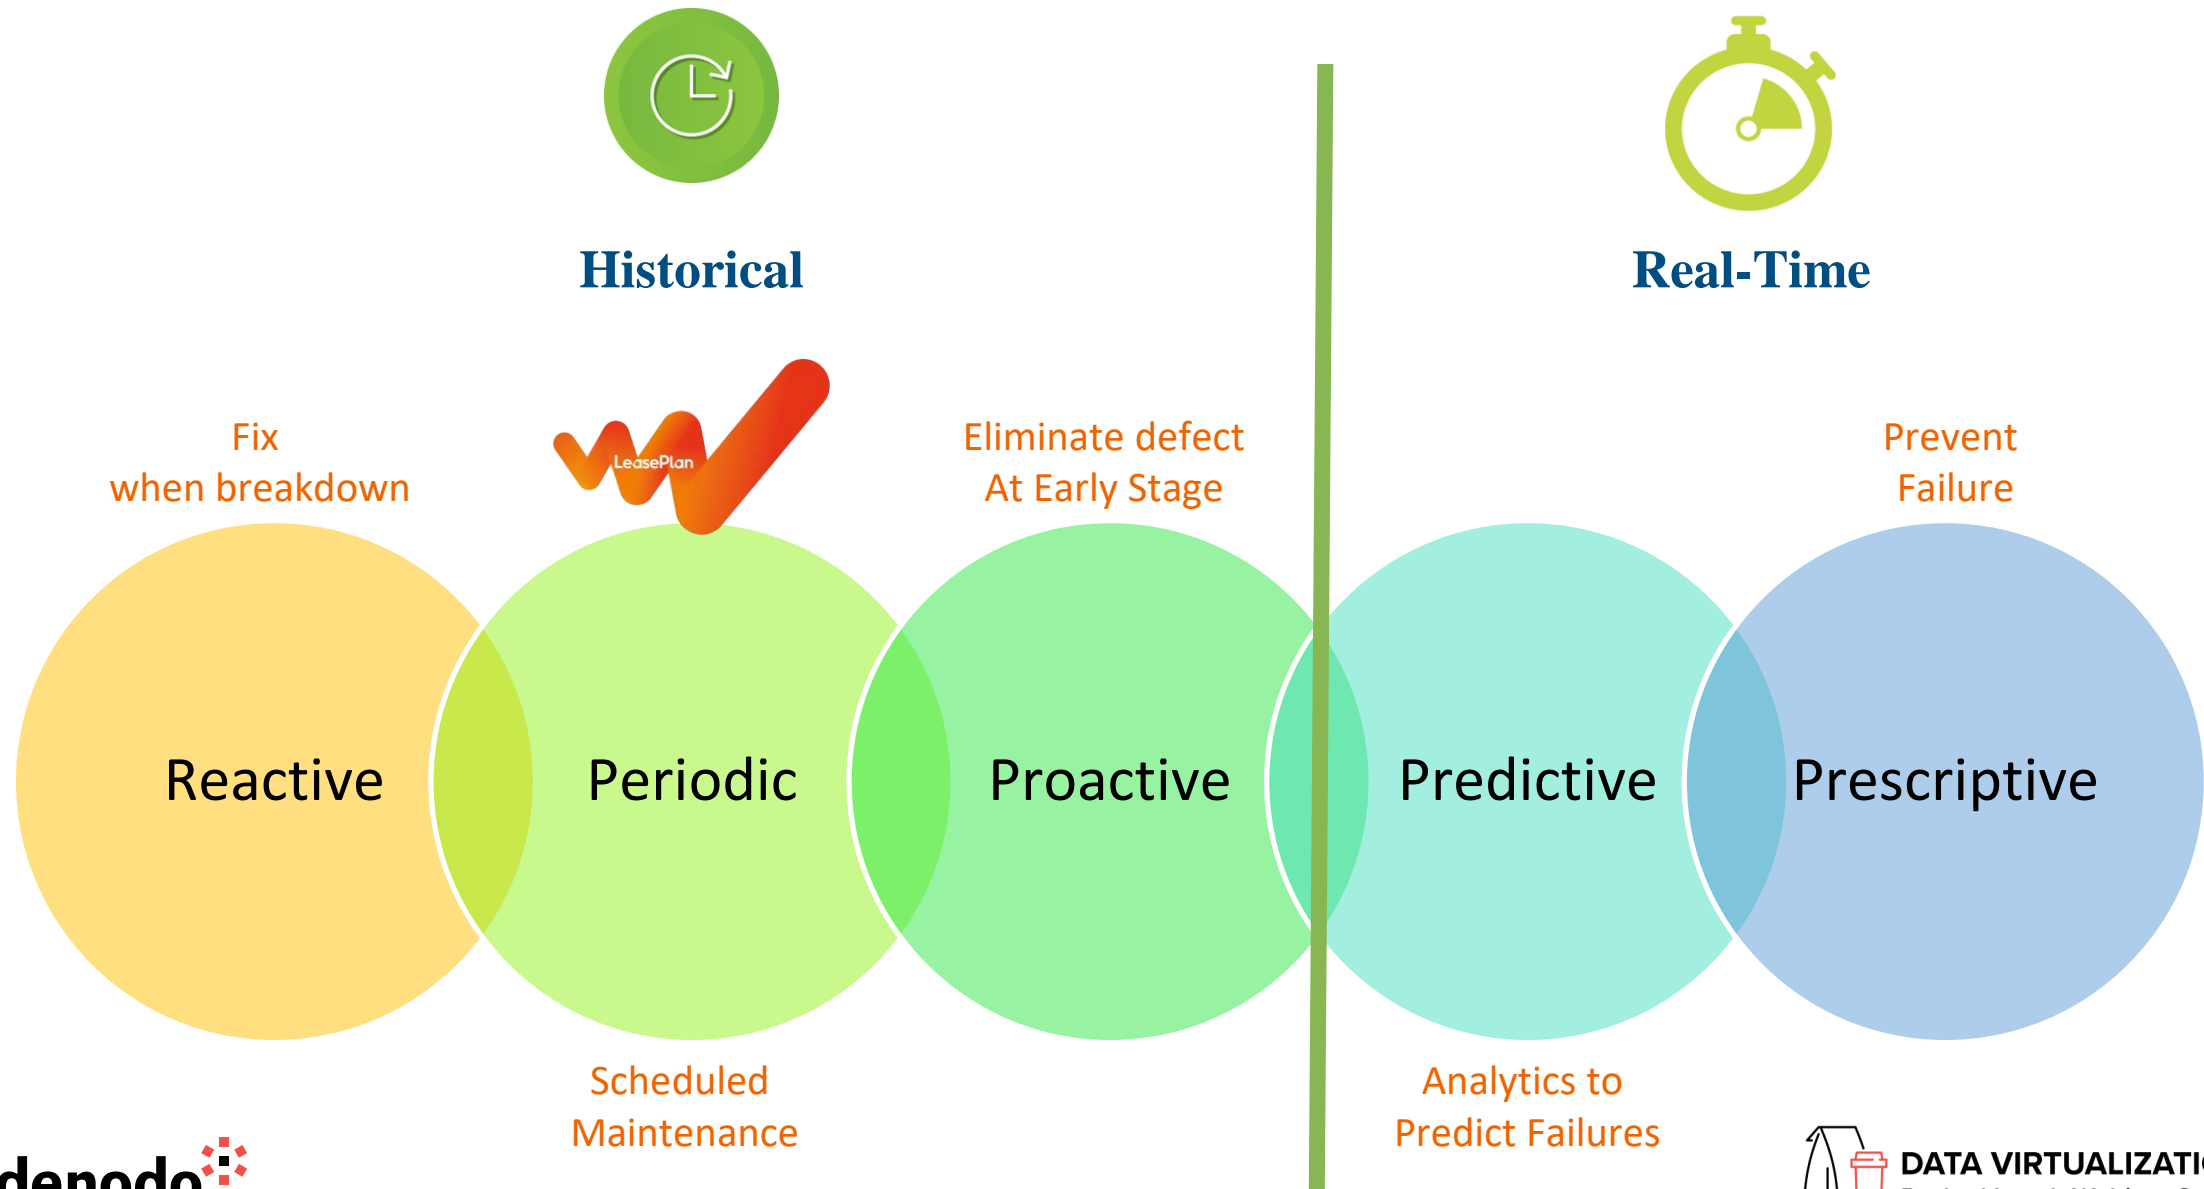

High-quality used car resale & leasing

Global Data Hub | Reference Architecture

Next Gen Data Management (Meta-data, data quality, governance)

Meta data management, data quality, data governance as central components guarding the overall data-asset of the corporation to allow trusted access to data for utilisation across the enterprise

denodo

“

Tools will change, data will stay – Need a scalable, easily maintainable, high performing data platform that keeps all together, and serve as a data fabric.”

Tekin Mentes, Head of Enterprise Data Management, LeasePlan

Problems with Self-Service BI/Analytics

The Self-Service Promise

1. Faster Data Delivery to the Business

- More people needs access to data to make decisions
- Users can solve their own information needs

2. Unlock Data for Advanced, Specialized Needs

- New users with advanced analytical skills and needs e.g., data scientists and citizen analysts can create customized analysis and reports

3. Avoid the BI/IT Bottleneck

- Huge data growth, operation costs → IT is looking for cheaper and more flexible solutions without disrupting the business

Self-Service: Problems

Problems with Self-Service Initiatives (Source: Eckerson Group)

- 64% of users rate their experience as “average” or “lower”
- +70% says “it requires more training than expected”
- +67% says “self-service tools are difficult to use”
- +60% says they “create informational chaos”

What is the Problem ?

Complexity:

- No unified infrastructure (multiple data sources and analysis / visualization tools)
- Integrate, transform and combine data is hard

Self-Service vs Governance

- Inconsistent reports / Single Source of Truth
- Compliance with company glossaries and policies
- How to enforce consistent security, data quality and governance policies across multiple systems

Do Data Governance Tools Solve the Problem ?

DG Tools allow:

- Informing about data assets and their level of quality
- Defining unified glossaries and terminology
- Defining data quality and data governance policies, and managing/tracking changes

Disconnected from the data delivery process

- Do not ensure delivered data conforms to glossaries
- Do not enforce security, data quality and governance policies in the data delivery process
 - The problem of how to enforce these policies across multiple data sources and consumption tools remain

The Role of Logical Data Fabric in Self-Service BI/Analytics

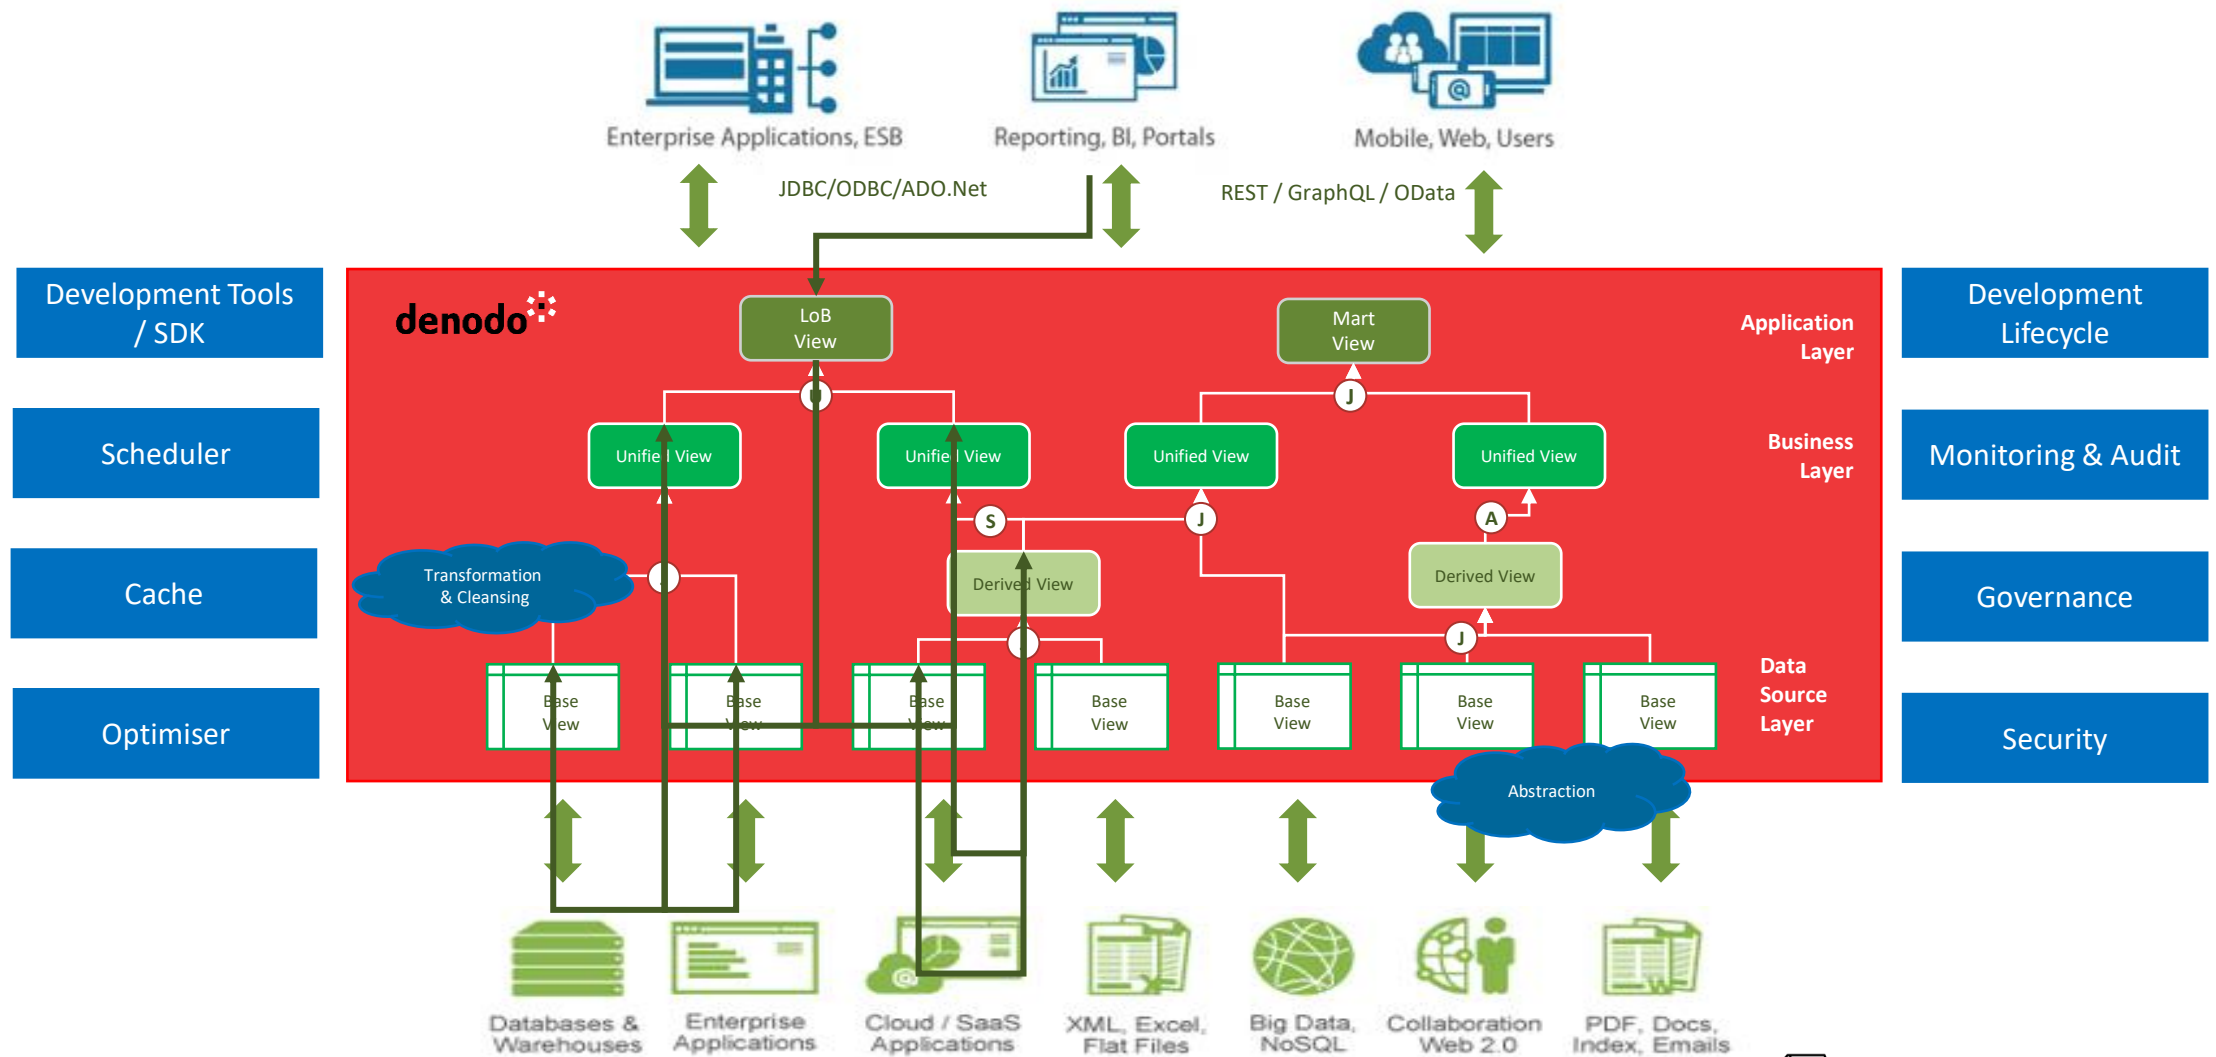

Denodo's Logical Data Fabric Enables Information Self-Service

1. Single Access Point to all Data at any location
2. Semantic Layer – Expose Data in Business-Friendly form, adapted to the needs of each consumer
3. Up to 80% reduction in integration costs, in terms of resources and technology data

4. Consume data with any tool and access technology (SQL, REST, GraphQL, OData,...)
5. Single entry point to apply security and governance policies

Data Virtualization: Logical Data Delivery for the Business

Data Virtualization for Data Governance

Single Entry Point
for Enforcing
Security and
Governance
Policies

Data on-premises
and off, combined
through the same
governed virtual
layer

Single Source of
Truth / Canonical

719608_C

The Practical Logical Data Warehouse (Dec 2020) by Henry Cook, Rick Greenwald and Adam Ronthal

Distributed and Logical Architectures

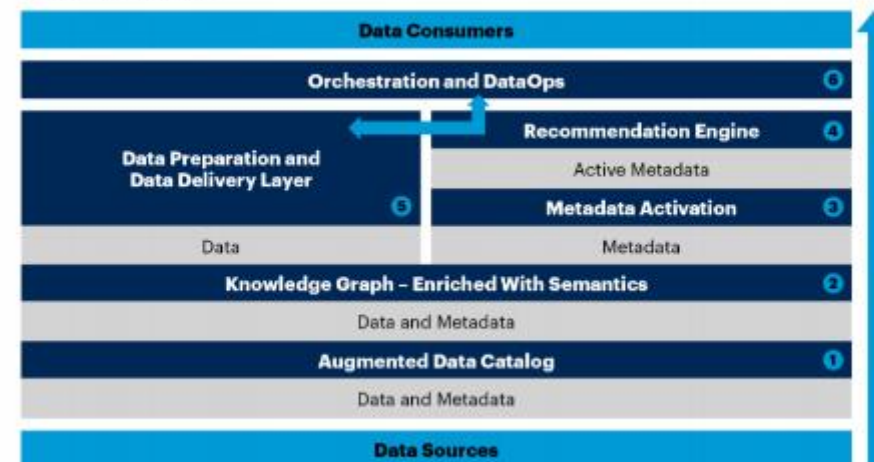

- **Distributed:** Data resides at multiple systems / locations
 - Data today is too big and distributed
 - Modern analytics needs are too diverse: one size never fits all
 - Hybrid and multicloud
- **Logical:** Consumers access data through semantic models, decoupled from data location and physical schemas
 - Semantic models adapt to consumer needs and enforce common policies
 - Not necessarily virtual/federated access: any delivery style including replication when needed
 - Allows for technology evolution and infrastructure changes (e.g. cloud transition)

Description This catalog data represents the evolution of one of our marketing campaigns over the months of the year, broken down by country. It helps visualize the impact of our marketing efforts in each country and relate to the different months and seasons.

Denodo Notebook for Data Science

- Combine queries, scripts, text and graphics to build “narratives” and share results
- Based on Apache Zeppelin
- Denodo users can create, save, and share their own notebooks
- Fully integrated with Denodo’s security system and SSO capabilities
- Accessible from the catalog

The screenshot displays the Zeppelin for Denodo notebook interface. The top navigation bar includes the Zeppelin logo, 'Notebook', 'Job', a search bar, and the user 'denodo'. The notebook title is 'Data Science'. The main content area is divided into several sections:

- Text:** 'Visualize the effect of different factors' (FINISHED). Below it, a paragraph explains writing GROUP BY queries to see relationships between factors (like rain, day of the week) and the total number of rides.
- Code:** A SQL query:

```
SELECT <factor>, AVG(trips_over_past_24_hours) FROM citibike.rides_with_details WHERE year = 2017 GROUP BY <factor>
```
- Figure:** A bar chart showing the average number of trips over the past 24 hours for different factors in 2017. The y-axis ranges from 0 to 64,914. The x-axis shows factors with values 29, 45, and 61. The chart is titled 'avg' and has a legend for 'Grouped' and 'Stacked'.
- Code:** A SQL query:

```
SELECT <factor>, AVG(trips_over_past_24_hours) FROM citibike.rides_with_details WHERE year = 2017 GROUP BY <factor>
```
- Code:** A SQL query:

```
SELECT <factor>, AVG(trips_over_past_24_hours) FROM citibike.rides_with_details WHERE year = 2017 GROUP BY <factor>
```
- Code:** A SQL query:

```
SELECT <factor>, AVG(trips_over_past_24_hours) FROM citibike.rides_with_details WHERE year = 2017 GROUP BY <factor>
```
- Code:** A SQL query:

```
SELECT <factor>, AVG(trips_over_past_24_hours) FROM citibike.rides_with_details WHERE year = 2017 GROUP BY <factor>
```

At the bottom, there is a status bar: 'Took 3 sec. Last updated by denodo at September 26 2019, 1:42:55 PM. (outdated)'.
